

How to Stop DDoS Attacks

1. Whenever a new browser is bought as a bundle with the OS or downloaded from the Windows Store. It will cost Rs.5,000 or more whichever is appropriate.
2. The Sites which want to avail our DDoS Attack prevention services should register with us.
3. Only those registered sites, which when accessed by a group will go through these following steps.
4. When DDoS attackers attack a Site, which has subscribed to our service. Attacking means continuously bugging the site in a short interval by a large mass of people, so that the site becomes overloaded and inaccessible.
5. When DDoS attack happens, Either DNS server is overloaded or DNS parses the Server address and the WebServer is overloaded.
6. We should penalize both these attackers.
7. What if an innocent user gets caught in the middle of an attack? Warn the attackers to back off immediately during every attack.
8. If you are get caught involved in DDoS attack for reasonable period of duration, your Rs.5,000 will be gone and next time you have to pay to use your browser.
9. Paying Rs.5,000 penalty follows the same process just like buying a new browser. UPI/Debit/Credit/Net Banking Can be used.

Integrate it with User Interface

1. Blink warning Icon on Status Bar (The one horizontal bar at the top) when an innocent user gets caught in the middle of the DDoS Attack and warn him not to bug the website. No one knows who the innocent user is for a while, so show blink warning for everyone when DDoS attacks happens till he backs off.
2. Find the average DDoS attack time a company can tolerate or put it as 5 minutes. If DDoS happens more than 5 minutes, Fine them all by changing the colour of the Blinking icon to black.
3. 5 minutes means, if you bug a website for more than 2 minutes it is DDoS activity. Because no one bugs a website for more than 2 minutes. It is unusual activity.

4. If they touch the black icon they will be redirected to Microsoft billing site, where they pay Rs. 5,000 again to re-use the Browser.
5. Even if they uninstall and re-install Internet Explorer, they have to pay Rs.5,000 again for buying the software.

Implement Database Integration

1. Collect data regarding who is doing DDoS attacks? Their IP Addresses, Phone Numbers while they buy the software and do datamining to find the culprits Bank Accounts and submit them to Cyber Crime Department of every country.
2. Collect from area which these DDoS attacks are coming.

Add API Endpoints for the system

1. Add APIs so that we can interact with other browsers, and databases to collect information about the culprits
